Tulips in the Netherlands

Figure: Tulips popularized in the sixteenth century in Holland. During the tulipomania, a viceroy (right) bulb could allegedly be exchanged for a basket of goods, some furniture, *and* some live stock. Today, 9M bulbs are produced annually, and tulips account for 25% of agricultural exports.

► Most tulip seeds need 12-14 weeks of "chill time" (below 55°F) before flowering

 $^{^{1}{\}rm https://github.com/luiarthur/Fall2014/tree/master/Stat637/project/tulip/data}$

- ► Most tulip seeds need 12-14 weeks of "chill time" (below 55°F) before flowering
- Various populations¹ of tulip seeds react to chill times differently

 $^{^{1} {\}tt https://github.com/luiarthur/Fall2014/tree/master/Stat637/project/tulip/data}$

- ► Most tulip seeds need 12-14 weeks of "chill time" (below 55°F) before flowering
- Various populations¹ of tulip seeds react to chill times differently
- Research Questions:

 $^{^{1} {\}tt https://github.com/luiarthur/Fall2014/tree/master/Stat637/project/tulip/data}$

- ► Most tulip seeds need 12-14 weeks of "chill time" (below 55°F) before flowering
- Various populations¹ of tulip seeds react to chill times differently
- Research Questions:
 - What is the effect of chilling time for each tulip population?

Figure: Germination rates across all tulips for 7 chilling time (weeks). Thirty measurements were made at each chilling time for each tulip population

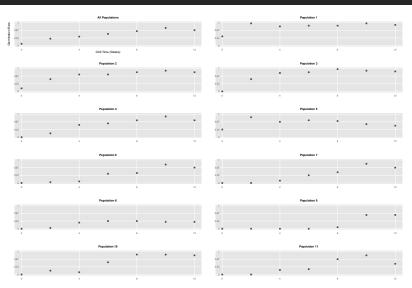

Figure: Germination rates of each tulip population by chilling times (weeks)

$$y_i \sim \ \ \mathsf{Bernoulli}(p_i) \ \Phi^{-1}(p_i) = \ \ \mathbf{b}(\mathbf{x_i})oldsymbol{eta}$$

$$\begin{array}{rcl} y_i \sim & \mathsf{Bernoulli}(p_i) \\ \Phi^{-1}(p_i) = & \mathbf{b}(\mathbf{x_i})\boldsymbol{\beta} \\ &= & \beta_0 + \sum\limits_{j=1}^3 \beta_j b_j(x_i) \end{array}$$

$$\begin{array}{ll} y_i \sim & \mathsf{Bernoulli}(p_i) \\ \Phi^{-1}(p_i) = & \mathbf{b}(\mathbf{x_i})\boldsymbol{\beta} \\ = & \beta_0 + \sum\limits_{j=1}^3 \beta_j b_j(x_i) + \sum\limits_{k=1}^{11} \beta_{0j} \cdot I\{\mathsf{pop}_i = k\} \end{array}$$

$$\begin{array}{ll} y_i \sim & \mathsf{Bernoulli}(p_i) \\ \Phi^{-1}(p_i) = & \mathbf{b}(\mathbf{x_i})\boldsymbol{\beta} \\ = & \beta_0 + \sum\limits_{j=1}^3 \beta_j b_j(x_i) + \sum\limits_{k=1}^{11} \beta_{0j} \cdot I\{\mathsf{pop}_i = k\} + \\ & \sum\limits_{k=1}^{11} \sum\limits_{j=1}^3 \beta_{1j} \cdot I\{\mathsf{pop}_i = k\} b_j(x_i) \end{array}$$

$$\begin{array}{ll} y_i \sim & \mathsf{Bernoulli}(p_i) \\ \Phi^{-1}(p_i) = & \mathbf{b}(\mathbf{x_i})\boldsymbol{\beta} \\ = & \beta_0 + \sum\limits_{j=1}^3 \beta_j b_j(x_i) + \sum\limits_{k=1}^{11} \beta_{0j} \cdot I\{\mathsf{pop}_i = k\} + \\ & \sum\limits_{k=1}^{11} \sum\limits_{j=1}^3 \beta_{1j} \cdot I\{\mathsf{pop}_i = k\} b_j(x_i) \end{array}$$

Let
$$\mathbf{W} = \mathbf{b}(\mathbf{X})$$
, $\boldsymbol{\beta} \sim \quad \mathsf{Normal}\left(\mathbf{0}, \sigma_b^2(\mathbf{W}'\mathbf{W})^{-1}\right)$

$$\begin{array}{ll} y_i \sim & \mathsf{Bernoulli}(p_i) \\ \Phi^{-1}(p_i) = & \mathbf{b}(\mathbf{x_i})\boldsymbol{\beta} \\ = & \beta_0 + \sum\limits_{j=1}^3 \beta_j b_j(x_i) + \sum\limits_{k=1}^{11} \beta_{0j} \cdot I\{\mathsf{pop}_i = k\} + \\ & \sum\limits_{k=1}^{11} \sum\limits_{j=1}^3 \beta_{1j} \cdot I\{\mathsf{pop}_i = k\} b_j(x_i) \end{array}$$

Let
$$\mathbf{W} = \mathbf{b}(\mathbf{X})$$
, $\boldsymbol{\beta} \sim \quad \mathsf{Normal}\left(\mathbf{0}, \sigma_b^2(\mathbf{W}'\mathbf{W})^{-1}\right)$

Note that for this Bayesian probit model, we can make use of the Albert and Chib (1993) algorithm to obtain the posterior for β .
